

How to find :

→ Should be a specially crafted http request, you can not find it with normal http request.

→ with a valid username and without password may bypass authentication in some circumstances.

→ you can bypass :

1. digest authentication

in request body if you find something like authorization parameter

2. web form authentication

just simple accept input without password but a valid username.

* How to find

1. find application based on appweb.

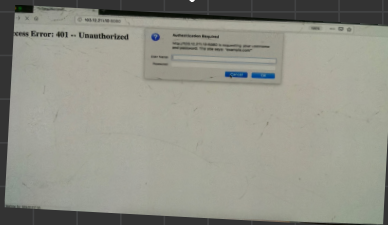

↳ Shodan → APPWEB

* Live

called "digest authentication"

①

②

capture request + send to repeater

③
